

Debales AI – AI Intern Assignment

Objective

Build a simple AI agent using LangGraph that can answer questions about Debales AI using RAG, use a SERP API tool for external queries, and return a clear final response.

Assignment

Create a chatbot (CLI or simple UI) that works as a Debales AI assistant.

1. RAG (Required)

Scrape content from Debales AI website, blog pages, and product/integration pages. Use this data as the knowledge base and retrieve relevant context before answering.

2. Tool Calling (SERP API – Required)

For questions not related to Debales AI, call a SERP API (Google Search API or equivalent), fetch results, and use them to generate the answer.

3. LangGraph Workflow

Design a simple flow that decides whether to use RAG or the SERP tool, then generates the final response.

Expected Behavior

Debales queries → RAG
Non-Debales queries → SERP API
Mixed queries → Both
Unknown queries → No hallucination

Submission Requirements

Source code
README with setup instructions
.env.example
Demo video explaining your code and approach

Example prompts and outputs

Evaluation Criteria

Correct routing (RAG vs tool)
Quality of scraping and retrieval
Proper use of SERP API
LangGraph workflow clarity
Code quality
Reliability (no hallucination)

Time Expectation

3–5 hours

Note

You may use AI tools, but you should understand your implementation and be able to explain it.
